### **1 Improve Visibility into the Design and Manufacturing Process**

With Autodesk Vault Professional, everyone in your organization can see the design and engineering data. Departments like procurement, marketing, and management can check out the latest drawings for review—without bothering the engineer or designer. And if your company is currently running Microsoft® SharePoint® software, it's even easier—Autodesk Vault Professional integrates right out of the box.

### **2 Improve Data Organization and Security**

Autodesk Vault Professional helps you track design changes and document revisions without asking you to do any more work. First, you can manage engineering change orders automatically—routing, tracking, auditing, and monitoring them as needed. Second, you can manage bills of materials (BOMs) generated directly from your CAD application. Finally, you can capture revisions automatically to securely access the latest released document or even review previous releases to see what has changed.

### **3 Create Reports and Manage Data Visually**

Need to know which parts have already been ordered? Want to know what specifications have changed since last week? With the visual data management in Autodesk Vault Professional, you can see the most relevant information right in the model. Autodesk Vault Professional helps you understand large amounts of data quickly, by showing it to you visually. Best of all, you can share that information with others through dashboard-style reporting tools.

### **4 Integrate Seamlessly with Existing Business Systems**

With Autodesk Vault Professional, it's easier to move from product data management (PDM) to true product lifecycle management (PLM). Autodesk Vault Professional is designed to integrate quickly and easily with your other business systems—from enterprise resource planning (ERP) to customer relationship management (CRM), giving your engineers critical insight into resource availability, inventory requirements, delivery dates, and more.

### **5 Collaborate Easily Across Multiple Sites**

If your organization has offices in multiple locations, Autodesk Vault Professional can make it incredibly easy and efficient for everyone to work together—no matter where they are in the world. You can track and manage all of your data in one central, secure location, but share actual working files quickly across a wide area network (WAN). This multisite flexibility is built into Autodesk Vault Professional, enabling you to scale up quickly as business demands increase.
